

Scheme directory 2008/9

The complete list of certificated members

Fire doors save lives & property

Fire doors and the building

The companies contained in this directory are members of the BWF-CERTIFIRE Fire Door and Doorset Scheme. They have sought and achieved independent third party certification for their fire door products. Third party certification comprises fire tests and verification of a fire door's design, performance, manufacturing process and quality assurance from manufacture to installation and includes any additional work carried out on the door, such as the addition of glazed vision panels, and the components fitted to them.

Fire doors are an important element in the fire safety of a building. They act as just another door for most, if not all of their lives. But, when a fire breaks out, they must work as an engineered safety device. All the components have to work together to hold back the lethal spread of smoke and flame for a specified time.

Fire doors are fitted as a result of needs identified in the Building Regulations. In England and Wales*, the Building Regulations are made up of parts (for example Part B) with associated approved documents providing guidance as to how these regulations can be achieved.

The principal regulation and guidance for fire doors is contained in *Approved Document B: 2006: Fire Safety (Volume 1: Dwellinghouses and Volume 2: Buildings other than dwellinghouses)*.

Approved Document B identifies:

- Where fire doors should be fitted,
- What minimum fire resistant periods should be expected,
- Whether or not they should be identified by additional labels,
- Any other necessary components such as smoke seals, closers
(E.g. FD30S required for hotel bedroom doors / office doors)

It also recommends the use of third party accredited products to ensure confidence that the required level of performance can be achieved.

*For Scotland, refer to the relevant sections of Scottish Building Standards – Technical Handbooks. For Northern Ireland, refer to the relevant sections of Northern Ireland Technical Booklets.

Technical Guidance and Approved Documents for the UK can be downloaded via the internet free of charge – for more detailed information visit the BWF website www.bwf.org.uk

In addition to fire resistance requirements, fire doors may also be required to fulfil Building Regulation requirements described in other relevant Approved Documents. In selecting and specifying the fire resistant requirements, architects, specifiers, builders and building owners should make sure they also consider these regulations.

Care must be taken when meeting these other conditions to ensure that the fire resistance certificate of a door is not invalidated.

Additional Approved Documents which apply to fire doors are:

Approved Document E – Resistance to the passage of sound: 2003

This requires a minimum sound resistance performance in some building locations, primarily between different owners/occupiers, for example between an apartment and a common area.

Approved Document F – Ventilation: 2006

In order to ensure that the air quality is maintained throughout a dwelling it is necessary to ensure air can move from one room to another through the gap beneath a door. This aspect also applies to fire doors in apartments and between rooms and a protected stairwell in a three or four storey house.

Approved Document L – Conservation of fuel and power: 2006

In some locations fire doors may also have to provide good thermal performance.

Approved Document M – Access to and use of buildings: 2004

This document introduces a number of recommendations to improve access to buildings for less able persons. These recommendations can have a significant effect on fire doors.

The principal recommendations contained in this document are concerned with: minimum door widths, visual contrast for doors and the surroundings, location of hardware, minimum opening and closing forces and the provision of vision panels.

Safety Glazing – Approved Document N: 1998

The additional needs of Approved Document M and aesthetic considerations also introduces safety concerns with respect to the glass. The fitting of glass in critical areas will introduce the need to ensure that the glass can resist impact or break safely as well as providing the correct fire resistant period.

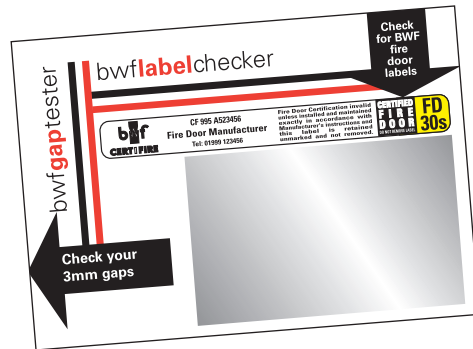

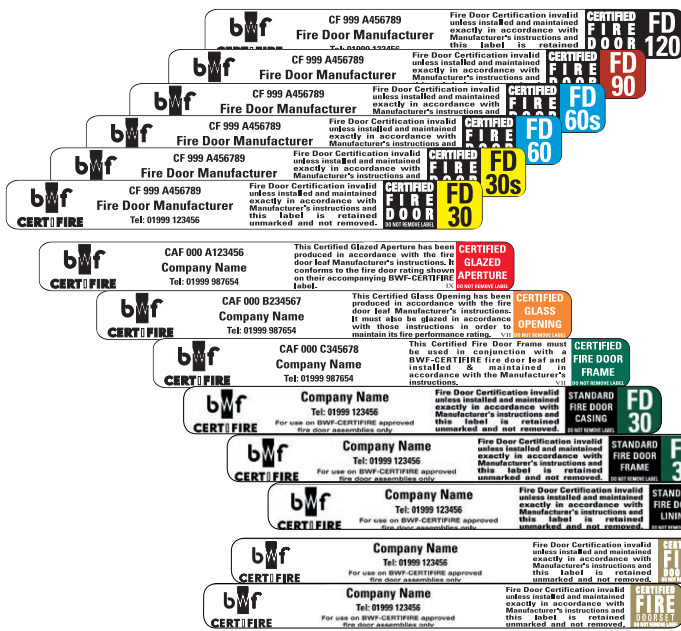

Security – Secured by Design Standards

Although not covered by the Building Regulations it is often necessary to provide security performance to other standards such as Secured by Design. This may inevitably introduce more locking points and the need for hardware manufactured to more rigorous BS EN standards which apply to security. (BS EN 12209:2003, BS 3621:2007, BS 8621:2007, BS EN 1303:2005, BS 10621:2007).

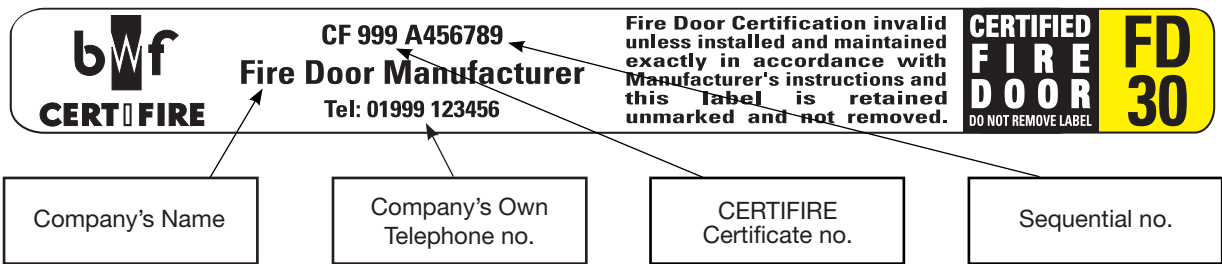

The impact of this on the fire resistance performance of the door assembly will need to be considered.

Labelling and Positioning

Safety at a glance

The bwfgaptester is 3mm thick to allow the installer/user to check the gap between the fire door leaf and the fire door frame. The mirror side was developed in order to "Look for the all-important BWF label" on the top of the door. To obtain a bwfgaptester please contact the BWF.

Unique number = Full traceability

Fire Door Certificates

Up until now, nearly everyone has used the phrase 'Fire Door Certificate' instead of the correct term 'successful fire test report'. The term 'Fire Door Certificate' should only be used when it has been provided by a UKAS Accredited Independent body such as CERTIFIRE.

- The permanent, tamper evident and fully traceable BWF-CERTIFIRE label is the principal means of communicating to everyone that the fire door leaf/frame/installation will perform to the rating stated on it.
- Where a 'hard-copy' document is required to be held on file by the relevant specifier, contractor or user to record the details of the fire doors supplied, then this can be obtained from the BWF-CERTIFIRE Manufacturer. This Certificate will therefore provide certificated evidence of the test for such a door assembly and will correspond to the appropriate BWF-CERTIFIRE CF No. on the label.
- The BWF-CERTIFIRE Scheme is designed to overcome the historical malpractice of copying "fire door certificates" to cover a variety of fire door applications.

Don't risk it - always look for the BWF Label!

Definitions

Fire door

A door leaf of a design which has been tested to have resistance to fire, and the main component of a fire door assembly.

Fire door frame

The door frame which is specially made by the third party certificated manufacturer of the fire door, or his licensed third party certificated customer, to be compatible with the fire door.

Glass opening

The special opening in a fire door which has been produced by a third party certificated manufacturer in preparation for glazing.

N.B. If the subsequent glazing is not carried out by a third party certificated body the fire door's certification will be made invalid.

Glazed aperture

A glass opening which has been glazed by a third party certificated body using the correct fire resistant glass, beads and intumescent glazing materials.

Fire doorset

A fire door leaf supplied pre-hung, in (or along with) its compatible fire door frame, hinges, glazing, intumescent fire (and smoke) seals and latch, supplied complete by the manufacturer.

Fire door assembly

All the correct, compatible and third party certificated elements of a fire doorset, but which have been collated together from different sources.

Fire door installation

A fire doorset, or fire door assembly finally installed satisfactorily, to comply with the Building Regulations and relevant British Standards.

SECTION 1 – Prime Fire Door & Doorset Manufacturer. Companies certified by CERTIFIRE to manufacture Fire Doors and Doorsets.

The correct installation of fire door assemblies and doorsets is fundamental to their overall performance in the event of a fire and should only be carried out by competent experienced professionals.

FIRAS is voluntary third-party certification for installers of fire protection systems and is operated by Warrington Certification. BWF and Warrington Certification have worked together in partnership to promote the concept of the FIRAS Fire Door Installers Scheme. By using a FIRAS certificated installer you can be confident that fire door installations are carried out safely and in total compliance with the Building Regulations.

Confirmation that a BWF-CERTIFIRE fire door assembly has been correctly installed is given by the attachment of the FIRAS permanent, tamper evident label.

For a list of FIRAS Certificated Installers of Fire Doors, please visit www.warringtonfire.net

*make sure the pieces fit –
look for the BWF-CERTIFIRE label*

The Scheme

The BWF-CERTIFIRE Fire Door & Doorset Scheme started in 1997 with the aim of improving the standards in fire doors by demanding the third-party certification of all fire doors manufactured by members. In the past 10 years or so, the Scheme has developed to represent companies involved in all areas of the supply chain including licensed converters, component suppliers and builders merchants. Installation of the doorsets is now controlled by the use of FIRAS certificated installers.

CERTIFIRE is voluntary third-party certification of fire protection products and similarly FIRAS is voluntary third-party certification for installers of fire protection systems. Both CERTIFIRE and FIRAS are operated by Warrington Certification.

Warrington Certification is a UKAS accredited certification body and is part of Bodycote warringtonfire who additionally carry out the fire testing in support of CERTIFIRE certification.

Third Party Certification

Certification is the corner-stone of the Scheme, with strict rules dictating the testing and auditing requirements for all Scheme members. Third party certification comprises fire tests and verification of a fire door's design, performance, manufacturing process and quality assurance from manufacture to installation.

All members are audited, while manufacturers and component suppliers are required to undergo regular audit testing. Fire door manufacturers and licensed converters need to have an ISO 9001 quality management system in place to ensure the consistent quality of their work.

Staff at BWF Approved Fire Door Centres are trained to understand the critical issues facing fire doors and the importance of selling compatible components.

Third party certification should be the minimum standard for fire doors and any fire protection product. After all, if it hasn't been tested, how do we really know it's going to work in the event of a fire?

Compatibility

It is impossible to over-emphasise how important the compatibility of the components used on a fire door are to it achieving its rating. Doorsets are the best solution, as the components are installed in a factory, in accordance with the fire test data sheets.

If, however, you need to purchase components separately, then it is vital that you use components identified in the door leaf installation instructions, attached to every fire door manufactured by Scheme members.

It is essential that the components used on a fire door have undergone the correct testing to ensure they will still fulfil their role in the event of a fire. Using incompatible components could cost lives!

Labels & Traceability

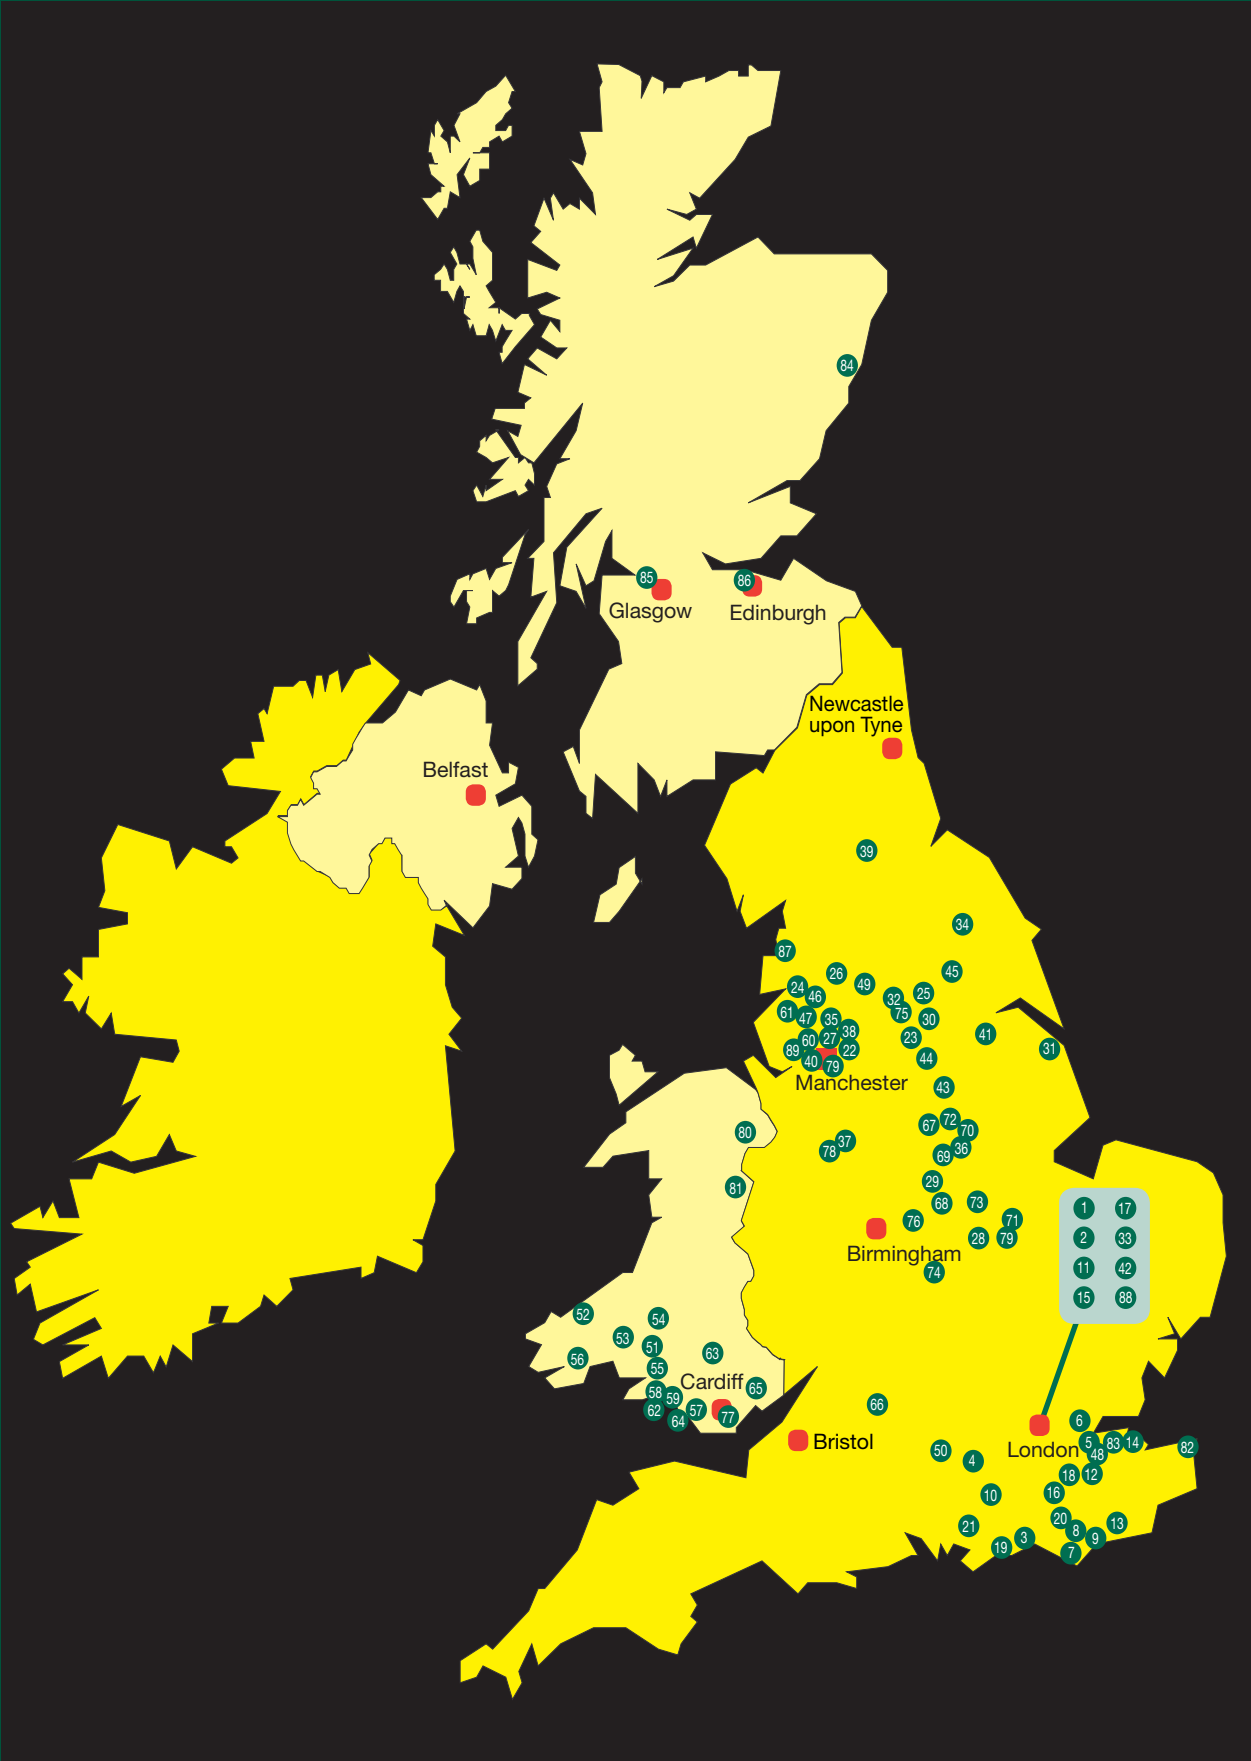

The Scheme requires all doors manufactured by its members to have a label stuck to the top edge of the door leaf, listing its rating, the manufacturer's name, phone number, the certification number and a unique serial number. If any alterations, including glass vision panels, are made to the door, Scheme members will place a second label on the door to maintain the certification.

This label provides traceability through the supply chain, and clearly identifies the certification of the door. If your fire door doesn't have a label, how do you know that it really is a fire door?
